

# WATER CYCLE ACTIVITY TWELVE

Cut out these pictures and captions then match them correctly. Arrange the pairs of cards in a circle so that they are in the correct order.

Sun warms the water on the land, sea, rivers and lakes.

Evaporation happens when water warmed by the sun turns to tiny droplets of water called water vapour. These rise into the air.

Plants and trees also make water vapour.

Condensation happens when water vapour cools high in the air and makes clouds.

Precipitation happens when this water vapour forms drops and falls back to the earth as rain (hail and snow are also precipitation).

Some water which falls to earth is stored in water storage lakes.

Water from the storage lakes is cleaned then sent through pipes for people to use.

People make water dirty. This wastewater is cleaned and sent back to the sea.
